#### **DETAILED ACTION**

### Response to Arguments

1. Applicant's arguments filed January 9, 2006 have been fully considered but they are not persuasive.

In response to Applicant's arguments, the recitation that "a method for the correction of a substantially linear distortion with two-fold symmetry" has not been give patentable weight because it has been held that a preamble is denied the effect of a limitation where claims is drawn to a structure and the portion of the claim following the preamble is a self-contained description of the structure not depending for completeness upon the introductory clause. *Krop v. Robia*, 88 USPQ 478 (CCPA 1951).

Therefore, the **102** and **103** rejection(s) to the claims are maintained and made final.

## Claim Rejections - 35 USC § 102

2. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

- (b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.
- 3. Claims 1-4, 16-18 and 33 are rejected under 35 U.S.C. 102(b) as being anticipated by Van Der Werf et al (US 2003/0003383).

Regarding claim 1, Van Der Werf et al disclose

Page 3

Art Unit: 2851

• "A method for the correction of a substantially linear distortion with two-fold symmetry in an extra-axial field region of an image plane of a projection lens that is non-telecentric on the object side and that is part of a microlithographic projection exposure apparatus ([0016], lines 1-4 and [0063, 0067]), with which

- a pattern contained in a reticle (MA; mask) can be imaged on a substrate (W; wafer) of a light-sensitive layer while the reticle (MA; mask) is traversed relative the projection lens (PL) along a scan direction at a first relative velocity ([0017], lines 5-13), comprising
- the step of tilting the reticle (MA; mask) for the correction of the distortion about a tilt axis that is disposed at least approximately perpendicular to an optical axis of the projection lens (PL) and to the scan direction ([0017], lines 9-13)."

Regarding claim 2, Van Der Werf et al disclose "wherein a wafer is traversed along the scan direction relative to the projection lens at a second relative velocity ([0033]), the ratio of the first traversing velocity to the second traversing velocity being predetermined by the linear magnification of the projection lens ([0056], lines 12-14)."

Regarding claims 3 and 4, Van Der Werf et al disclose wherein the tilt axis extends through "a region" and "the middle of the region" of the reticle that is exposed to projection light ([0058], lines 7-10)."

Regarding claim 16, Van Der Werf et al disclose "wherein additionally the linear magnification of the projection lens is changed ([0044], lines 6-9)."

Application/Control Number: 10/815,116 Page 4

Art Unit: 2851

Regarding claims 17 and 18, Van Der Werf et al disclose wherein the projection lens exclusively has mirrors as imaging components and wherein the projection lens has at least four mirrors ([0011]).

Regarding claim 33, Van Der Werf et al disclose

- "a) providing a substrate onto which a layer of a light-sensitive material is applied at least partially ([0010], lines 3-4);
  - b) providing a reticle that contains structures to be imaged ([0004], line 9);
- c) providing a projection exposure apparatus with a projection lens ([0011], lines 5-6);
- d) correction of a distortion of the projection lens in accordance with the method as specified in claim 1 ([0066], lines 1-5);
- e) projecting at least a part of the reticle onto a region on the layer with the aid of the projection exposure apparatus ([0004], lines 4-6)."

## Claim Rejections - 35 USC § 103

- 4. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
  - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

5. Claim 5-7 are rejected under 35 U.S.C. 103(a) as being unpatentable over Van Der Werf et al in view of Fujisawa et al (US 2003/0090640).

Regarding claims 5-7, Van Der Werf et al disclose where the reticle can be tilted about an axis and where the position of the wafer is displaceable. Van Der Werf et al does not disclose (claim 5) "wherein additionally the wafer is tilted about a further tilt axis that extends parallel to the tilt axis about which the reticle is tilted; (claim 6) "wherein the reticle and the wafer are tilted about tilt angles, the ratio of which is, in terms of magnitude, substantially equal to the linear magnification of the projection lens;" and (claim 7) "wherein the tilt axes about which the reticle and the wafer are tilted have spacings from the optical axis, the ratio of which is, in terms of magnitude, substantially equal to the linear magnification of the projection lens."

However, having the axes and tilt of the reticle and wafer in a way as aforementioned above is known to the art as it is evident by the teaching of Fujisawa et al ([0064], lines 13-16, where the change of tilt angle of the wafer is performed by the driving mechanism 111). Thus, it would have been obvious to one ordinary skilled in the art at the time the invention was made to modify the wafer stage of Van Der Werf et al by having it being tilted by the driving mechanism as taught by Fujisawa for at least the purpose of performing an aberration correction.

6. Claim 8 is rejected under 35 U.S.C. 103(a) as being unpatentable over Van Der Werf et al in view of Suzuki (5,796,467).

Art Unit: 2851

Van Der Werf et al discloses a moveable substrate, but does not disclose "wherein the substrate is displaced in the image plane for the correction of a field-constant portion of the distortion."

However, having a substrate displaced in the image plane for the correction of a field-constant portion of the distortion is known to the art as it is evident by the teaching of Suzuki (col. 1, lines 47-49 and lines 58-61). Thus, it would have been obvious to one ordinary skilled in the art at the time the invention was made to modify the substrate table of Van Der Werf et al by having the substrate displaced in the image plane for at least the purpose to obtain a less distorted image.

7. Claims 9, 10 and 13-15 are rejected under 35 U.S.C. 103(a) as being unpatentable over Van Der Werf et al in view of Fujisawa et al.

Regarding claims 9, 10 and 13, Der Werf et al disclose all of the claimed limitations except "wherein additionally at least one optical element of the projection lens is changed in its spatial position."

However, having at least one optical element of the projection lens is changed in its spatial position parallel to the optical axis and perpendicular to the scanning direction is known to the art as it is evident by the teaching of Fujisawa et al ([0066], lines 2-4, a lens control unit control a driving element to drive the lens elements in a direction in the optical axis). Thus, it would have been obvious to one ordinary skilled in the art at the time the invention was made to modify the projection lens of

Art Unit: 2851

Der Werf et al by including a driving element to control change the spatial position of the projection lens for at least the purpose of performing an aberration correction.

Regarding claims 14 and 15, Van Der Werf et al disclose all of the claimed limitations except (claim 14) "wherein the at least one optical element is tilted about a tilt axis that is disposed at least approximately perpendicular to the optical axis of the projection lens and to the scan direction" and (claim 15) "wherein the at least one optical element is tilted about a tilt axis that is disposed at least approximately perpendicular to the optical axis of the projection lens and parallel to the scan direction."

However, wherein the at least one optical element is tilted about a tilt axis that is disposed at least approximately perpendicular to the optical axis of the projection lens and at least perpendicular to the scan direction or parallel to the scan direction is known to the art as it is evident by the teaching of Fujisawa et al ([0066], lines 63-66). Thus, it would have been obvious to one ordinary skilled in the art at the time the invention was made to modify the projection lens of Van Der Werf et al by including a driving element to perform a tilt in a manner described above for at least the purpose to as aforementioned above for at least the purpose of adjusting an aberration.

8. Claims 11-12 are rejected under 35 U.S.C. 103(a) as being unpatentable over Van Der Werf et al in view of Fujisawa et al, as applied to claim 9, and in further view of Suzuki.

Van Der Werf et al, as modified, disclose all of the claimed limitations except "wherein the at least one optical element is displaced translationally in a plane perpendicular to the optical axis."

However, having at least one optical element displaced in a plane perpendicular to the optical axis and in the scan direction is known to the art as it is evident by the teaching of Suzuki (col. 7, lines 63-66). Thus, it would have been obvious to one ordinary skilled in the art at the time the invention was made to further modify the projection lens of Van Der Werf et al by including means to drive an optical element of the projection lens for at least the purpose to incline the imaging plane.

#### Conclusion

9. THIS ACTION IS MADE FINAL. Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

examiner should be directed to Kevin Gutierrez whose telephone number is (571)-272-

5922. The examiner can normally be reached on Monday-Friday: 7:30 a.m. - 4:30

p.m..

If attempts to reach the examiner by telephone are unsuccessful, the

examiner's supervisor, Judy Nguyen can be reached on (571)-272-2258. The fax

phone number for the organization where this application or proceeding is assigned is

571-273-8300.

Information regarding the status of an application may be obtained from the

Patent Application Information Retrieval (PAIR) system. Status information for

published applications may be obtained from either Private PAIR or Public PAIR.

Status information for unpublished applications is available through Private PAIR only.

For more information about the PAIR system, see http://pair-direct.uspto.gov. Should

you have questions on access to the Private PAIR system, contact the Electronic

Business Center (EBC) at 866-217-9197 (toll-free).
